ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB The present invention aims to improve cycle characteristics of a high-capacity secondary battery wherein an active material is filled in at a high d. by using a particulate active material having a small aspect ratio. Disclosed is a nonaq. electrolyte secondary battery comprising a pos. electrode and neg.

electrode capable of adsorbing/desorbing lithium, a separator and a nonaq. electrolyte solution containing a nonaq. solvent and a lithium salt is characterized in that the separator has a porous film composed of a thermoplastic resin containing an inorg. filler, and in that the active material contained in the neg. electrode is a particulate active material having an aspect ratio of not less than 1.02 and not more than 3 and/or the active material contained in the pos. electrode is a particulate active material having an aspect ratio of not less than 1.02 and not more than 2.2.

IT 92-52-4, 1,1'-Biphenyl, uses 827-52-1

AB The title electrolyte solution contains lithium salt, carbonate- and/or ether-based organic solvent, additive for safe overcharging, and other functional additive. The lithium salt has a concentration of 0.001-2 M. The additive for safe overcharging has a mass ratio of 0.01-30 weight% of the electrolyte. The other functional additive has a concentration of 0-0.5 M. The additive for safe overcharging is selected from compds. shown in structures I and II (A = C or Si; R1,2 = alkyl, alkoxy, alkenyl, etc.; R3 = cyano, isocyano, thiocyno or isothiocyno; R4-8 = H, halogen, alkyl, alkoxy, etc.).

AB This manufacturing comprises (by weight percentage) electrochem. inert polymer with mol. weight of 5,000-120,000 0.5-15, Li salt 6-18, film forming agent 0.5-8, over charge-preventing agent 0-10, flame retardant 0-15, surfactant 0.01-0.5, and electrolyte stabilizing agent 0.05-0.5 in nonaq. solvent. The polymer can be polymethyl methacrylate, polyacrylonitrile, polytetrafluoroethylene, etc.; the Li salt can be LiPF₆, Li tetrafluoroborate, Li hexafluoroarsenate, etc.; and the nonaq. solvent can be carbonate ester, carboxylate ester, ether, etc. The battery using inventive electrolyte has the characteristics of conventional polymer battery and liquid battery, and further has the advantages of high safety performance, long service life, excellent low temperature performance and high rate charge/discharge performance, and simple fabrication.

AB The invention provides an electrolyte solution for a high-rate discharge Li ion battery, and a Li ion battery using the same. The electrolyte soln. is composed of (by weight%) Li salt 13-15, organic solvent 75-82, and additive 3-7. The Li salt is ≥ 1 of LiPF₆, Li tetrafluoroborate, Li bis(oxalate) borate, etc. The organic solvent is ≥ 1 of ethylene carbonate, propylene carbonate, Et Me carbonate, diPr carbonate, γ -butyrolactone, THF, MeCN, EtOAc, Et formate, Pr formate, and sulfones. The additive is ≥ 1 of vinylene carbonate, biphenyl, cyclohexyl benzene, difluoromethyl formamide, and di-Me acetamide. The inventive electrolyte solution is applicable to a high-rate discharge Li ion battery; it is obviated from increased battery surface temperature when high-rate discharge is performed, and can meet 3C10V overcharge requirement.

 OTHER SOURCE(S): MARPAT 150:98463
 AB Lithium borate chelate salts Li

[(C2O2)B[OCY1Y2(CR1R2)n(CY3Y4)o(CO)mO]] (1) and Li
 [F2B[OCY1Y2(CR1R2)n(CY3Y4)o(CO)mO]] [2; for 1, 2: Y1+Y2 = O, Y1-Y4 = alkoxy,
 H, halo, alkyl; R1, R2 = H, halo, alkoxy, alkyl; m, n, o = 0, 1; preferably
 OCY1Y2(CR1R2)n(CY3Y4)o(CO)mO = L = oxalato, malonato, glycolato, salicylato,
 lactato, catecholato], useful as electrolytes for lithium-ion rechargeable
 batteries, free of water and acidic impurities, were prepared by a process,
 comprising treatment of the raw compds. 1 and 2, containing 0.2% of water and
 ≥ 100 $\mu\text{mol/g}$ of acidic impurities, with 0.01-1% of LiH of ≤ 100 μm particle size
 in an inert, optionally fluorinated organic solvent with b.p. of 110-280°
 under reflux and stirring or in a solvent-free conditions, for 0.5-24 h,
 followed by filtration or distillative removal of the solvent and recrystn. of
 the pure products 1, 2 from polar solvents, preferably from alkylene
 carbonates. Purified compds. 1 and 2 show decomposition temps. by 50-60°
 higher, than raw materials. In an example, 1.18 kg of raw lithium
 bis(oxalato)borate Li[(C2O4)2B] (1a), containing 800 ppm of water content was
 dried and de-acidified by refluxing with 1.9 g of LiH powder in 2.9 Halpasol
 166-170 hydrocarbon mixture at 166-167° for 2.5 h with subsequent distillation
 of the solvent, at final pressure of 15 mbar. The part of the resulting solid
 (263 g), containing 1a, was purified by dissoln. in 1380 g of dry propylene
 carbonate (water content 30 ppm) for 3 h at 120° and filtration through 100 nm
 membrane filter, distillative removal of 971 g of propylene carbonate at 150-
 155° and 10 mbar, cooling to 100°, crystallization and filtration, giving the
 product 1a with 5.7 $\mu\text{mol H}^+$ /g acidity and 81 ppm of water.

AB The title method comprises: injecting 40-85% 1st electrolyte solution, which contains 0.1-1.0 mol/L lithium salt and a mixture of a linear acid ester and a film forming additive into a secondary lithium battery; aging; performing primary charging; injecting 15-60% 2nd electrolyte solution, which contains the lithium salt, the mixture of a linear acid ester, and an overcharge additive into a secondary lithium battery; and performing secondary charging. The invention effectively improves comprehensive electrochem. performances of the battery.

AB The title electrolyte solution contains an electrolyte salt, an organic solvent, and an additive composed of 0.2-8.2% biphenyl, 1.0-9.0% cyclohexyl benzene, and 0.1-5.1 lithium salt selected from lithium carbonate, lithium sulfite, and lithium sulfate. The inventive electrolyte can improve comprehensive performance of secondary lithium battery, such as overcharge performance, high-temperature performance, and low-temperature discharge performance, etc.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB The present invention aims to improve cycle characteristics of a high-capacity secondary battery wherein an active material is filled in at a high d. by using a particulate active material having a small aspect ratio. Disclosed is a nonaq. electrolyte secondary battery comprising a pos. electrode and neg. electrode capable of adsorbing/desorbing lithium, a separator and a nonaq. electrolyte solution containing a nonaq. solvent and a lithium salt is characterized in that the separator has a porous film composed of a thermoplastic resin containing an inorg. filler, and in that the active material contained in the neg. electrode is a particulate active material having an aspect ratio of not less than 1.02 and not more than 3 and/or the active material contained in the pos. electrode is a particulate active material having an aspect ratio of not less than 1.02 and not more than 2.2.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB Provided are methods of purification of an organic lithium salt comprising the steps of: (a) dissolving an impure organic lithium salt in a solution comprising an organic complexing solvent; (b) crystallizing from said solution a solid solvate complex comprising said lithium salt and said organic complexing solvent; (c) separating said solid solvate complex from said solution; (d) dissociating said solid solvate complex to yield: (i) said lithium salt in a solid form, and, (ii) a volatile composition comprising said organic complexing solvent; and, (e) removing said volatile composition to yield said lithium salt in a solid form of purity greater than the purity of said impure lithium salt. The present invention also pertains to electrolytes for elec. current producing cells comprising such purified lithium salts. Thus, (CF₃SO₂)₂NLi was purified by crystallization of the 1,4-dioxane complex and heating under vacuum at 125° to remove the dioxane.

AB The elec. conductivity of 150 electrolyte solns. of nonaq. (esters, ethers,
 aromatic and chlorinated organic compds.) solvents and Li salts [LiPF₆, LiBF₄,
 LiAsF₆, LiCF₃SO₃, and LiN(CF₃SO₂)₂], for rechargeable Li batteries, was
 measured as a function of temperature, between -60 to 80°. The effect of
 viscosity of electrolyte solns. on the conductivity was also determined
 Addition of aromatic and halogenated organic solvents enhanced electrolyte
 conductivity
